LECTURE 09 MORPHOLOGICAL IMAGE PROCESSING

Punnarai Siricharoen, Ph.D.

OBJECTIVES

morphology

- To understand basic morphological image processing techniques
- To be able to apply morphological techniques as development basis for segmentation, automated inspection, or describing an image with the simple to moderate complexity of the problems

mostly we apply on binary

CONTENT

- Introduction
- Logic operation with binary images
- Dilation / Erosion
- Closing / Opening
- Hit-or-miss transformation
- Other morphological algorithms
- Thinning/Thickening/Skeleton/Pruning
- Applications of grayscale morphology

INTRODUCTION

- **Morphology** *post-process*

- A technique used to analyze and manipulate the **shape and structure** of objects within an image.
- applying a set of mathematical operations to an input image to extract useful information or to modify the image in a way that **enhances certain features or removes unwanted details**.
- Morphological operations are primarily used in **binary or grayscale** images and are especially useful in tasks like **image segmentation**, **noise reduction**, **object extraction**, and **feature enhancement** by extracting image components useful for representation and description of region shape, such as
 - **Boundaries**
 - **Skeletons**
 - **Convex hull**
- **Morphological techniques** – pre- or post-processing, such as morphological filtering, thinning and pruning.

INTRODUCTION

Preliminaries:

Intro to set

- Let A be a set in Z^2 if $a = (a_1, a_2)$ is an element of A , we write

$$a \in A$$

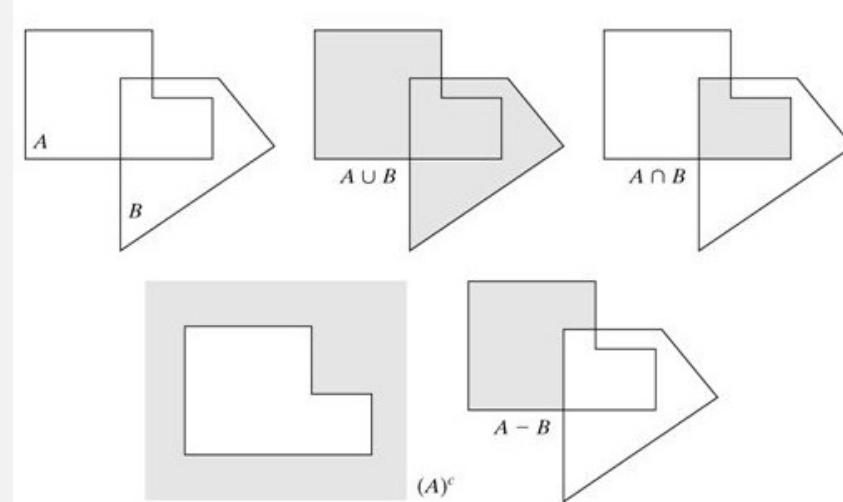

- If a is not an element of A , we write

$$a \notin A$$

- Null or empty set: \emptyset

- Every element of set A is also an element of another set B , or A is a subset of B

$$A \subseteq B$$

a b c
d e

FIGURE 9.1

INTRODUCTION

Preliminaries:

- The union of two sets, A and B:

$$C = A \cup B$$

- The intersection of two sets, A and B:

$$C = A \cap B$$

- Two sets are mutually exclusive.

$$A \cap B = \emptyset$$

► complement:

$$A^c = \{w | w \notin A\}$$

► Difference of the two:

$$A - B = A \cap B^c$$

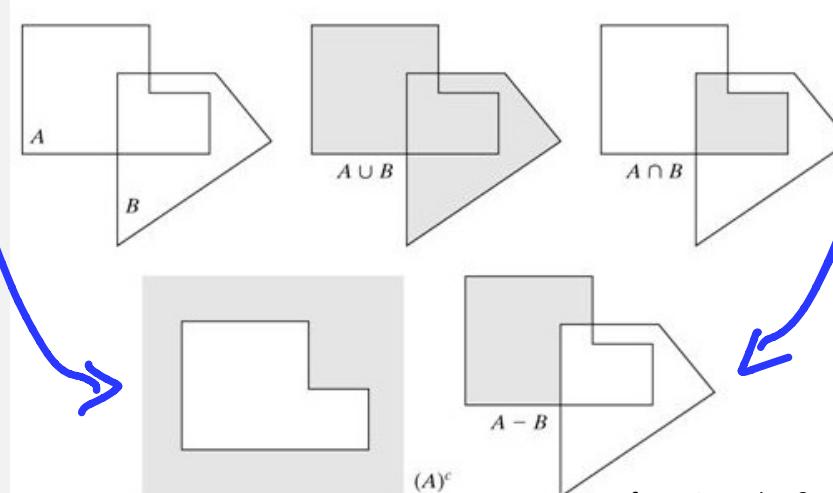

FIGURE 9.1
(a) Two sets A and B. (b) The union of A and B. (c) The intersection of A and B. (d) The complement of A. (e) The difference between A and B.

INTRODUCTION

Preliminaries:

- Reflection:

$$\hat{B} = \{w | w = -b \text{ for } b \in B\}$$

- Translation of A by point $z = (z_1, z_2)$
denoted $(A)_z$

$$(A)_z = \{c | c = a + z \text{ for } a \in A\}$$

a b

FIGURE 9.2

(a) Translation of A by z .
(b) Reflection of B . The sets A and B are from Fig. 9.1.

LOGIC OPERATION WITH BINARY IMAGES

pixel-wise

(A) XOR (B)

[NOT (A)] AND (B)

DILATION / EROSION

ขยาย / พองตัว

กร่อน

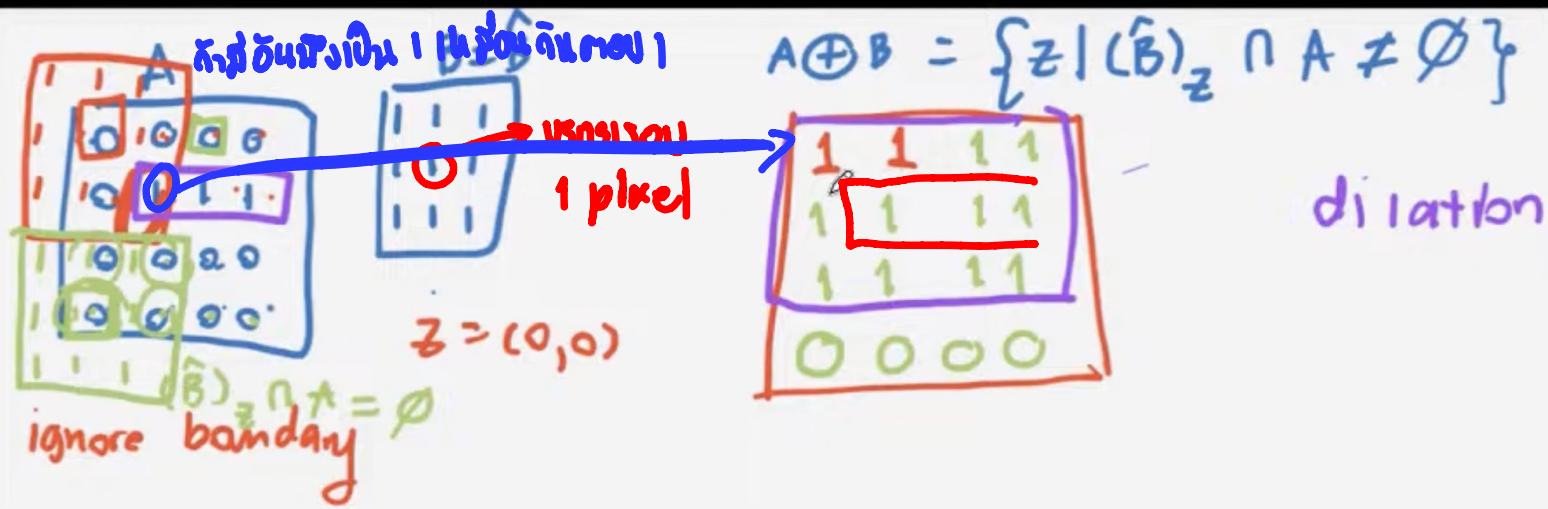

- Fundamental morphological operations.
- Many other morphological algorithms are based on these primitive operations.
- **Dilation:**

- With A and B as sets in Z^2 , the dilation of A by B , denoted $A \oplus B$

$$A \oplus B = \{z | (\hat{B})_z \cap A \neq \emptyset\}$$

Flip & displace

- Dilation of A by B is the set of all displacements that (\hat{B}) overlap A by at least elements.
- B is called '**Structuring element**' (Convolution mask).

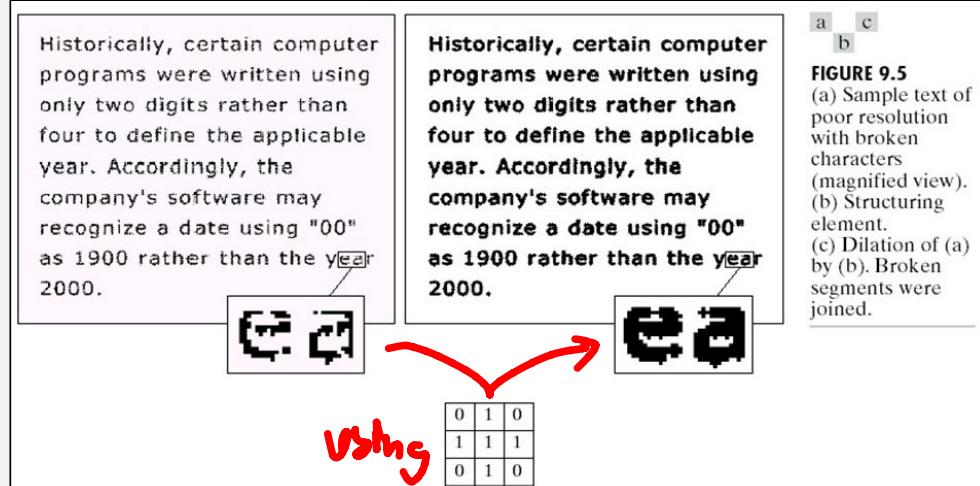

DILATION / EROSION

Dilation – set operations
Convolution - arithmetic operations

- **Dilation:** or can write,

$$A \oplus B = \{z | (\hat{B})_z \cap A \subseteq A\}$$

- **Application:** use dilation for bridging gaps. *make it thicker*

The dilation of A by B is the set of all displacements z that B and A overlap at least one elements.

FIGURE 9.4
 (a) Sample text of poor resolution with broken characters (magnified view).
 (b) Structuring element.
 (c) Dilation of (a) by (b). Broken segments were joined.
 (d) Elongated structuring element.
 (e) Dilation of A using this element.

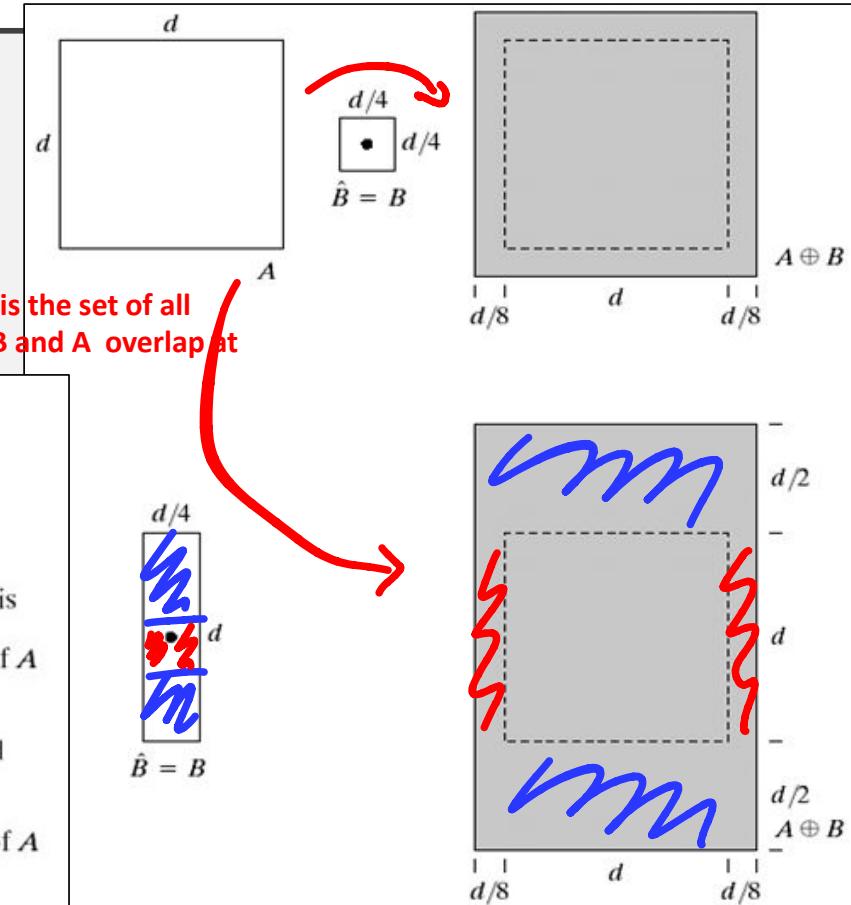

Image from Gonzalez & Woods, Digital Image Processing

DILATION / EROSION

- **Erosion:** B translated by z is contained in A.

$$A \ominus B = \{z | (B)_z \subseteq A\}$$

- Dilation and erosion are duals of each other with respect to set complementation and reflection: $(A \ominus B)^c = A^c \oplus \hat{B}$

Erosion – Erosion of A by B is the set of all points z that B translated by z is contained in A!

a b c
d e

Image from Gonzalez & Woods, Digital Image Processing

DILATION / EROSION

Python:

```
import cv2  
  
import numpy as np  
  
img = cv2.imread('text.png', 0)  
  
kernel = np.ones((3,3),np.uint8)  
  
erosion = cv2.erode(img,kernel,iterations = 1)  
  
dilation = cv2.dilate(img,kernel,iterations = 1)
```

Python: `cv2.dilate(src, kernel[, dst[, anchor[, iterations[, borderType[, borderValue]]]]]) → dst`

Python: `cv2.erode(src, kernel[, dst[, anchor[, iterations[, borderType[, borderValue]]]]]) → dst`

Parameters:

- **src** – input image; the number of channels can be arbitrary, but the depth should be one of `cv_8u`, `cv_16u`, `cv_16S`, `cv_32F` or `CV_64F`.
- **dst** – output image of the same size and type as `src`.
- **element** – structuring element used for erosion; if `element=Mat()` , a 3×3 rectangular structuring element is used.
- **anchor** – position of the anchor within the element; default value $(-1, -1)$ means that the anchor is at the element center.
- **iterations** – number of times erosion is applied.
- **borderType** – pixel extrapolation method (see `borderInterpolate()` for details).
- **borderValue** – border value in case of a constant border (see `createMorphologyFilter()` for details).

Original

The term watershed
refers to a ridge that ...
... divides areas
drained by different
river systems.

Erosion

Dilation

Image from Gonzalez & Woods, Digital Image Processing

CLOSING / OPENING

Dilate – expand
Erode – shrink

separate object

- **Opening** – smooth the contour of an object. Break narrow isthmus and eliminates thin protrusions.

$$A \circ B = (A \ominus B) \oplus B \quad \text{Erode then dilate..}$$

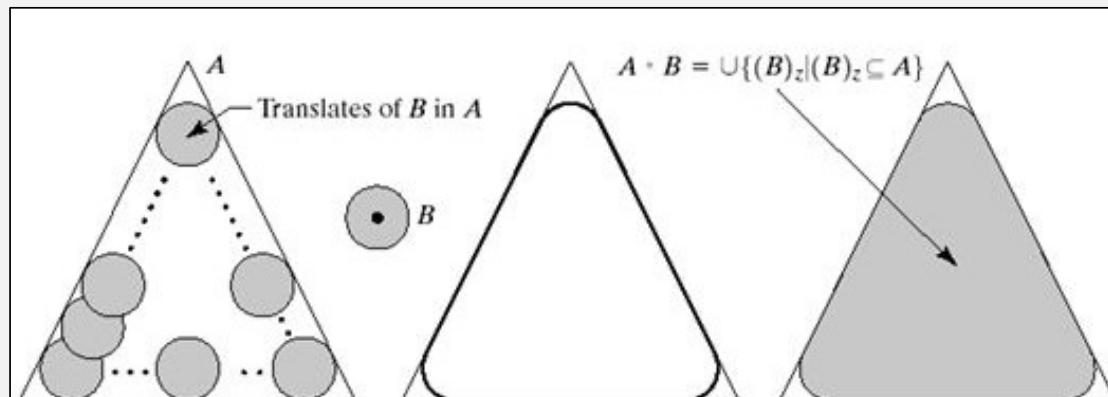

FIGURE 9.8 (a) Structuring element B “rolling” along the inner boundary of A (the dot indicates the origin of B). (c) The heavy line is the outer boundary of the opening.
(d) Complete opening (shaded).

Image from Gonzalez & Woods, Digital Image Processing

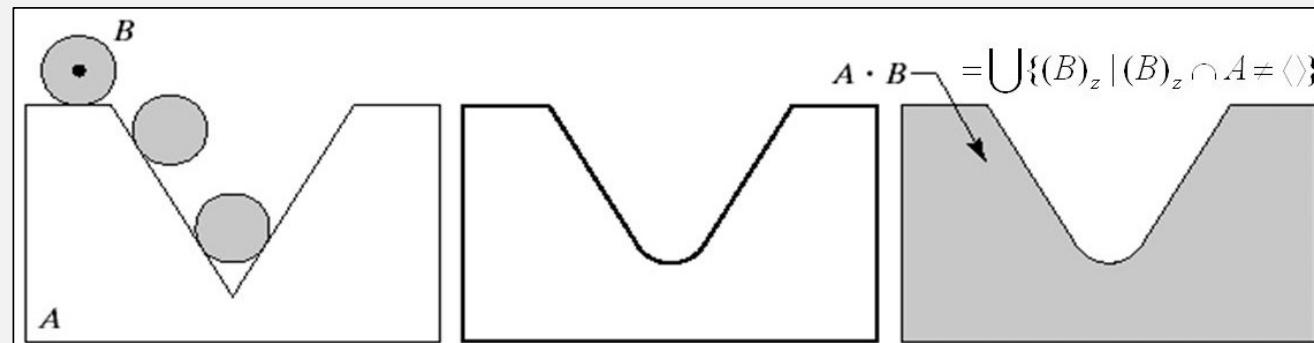

fill the hole, merge gap

CLOSING / OPENING

Dilate – expand
Erode – shrink

- **Closing** – smooth sections of contours but **fuse narrow breaks and long thin gulfs**. Eliminate small **holes** and **fill gaps** in the contour.

$$A \bullet B = (A \oplus B) \ominus B \quad \text{Dilate then erode..}$$

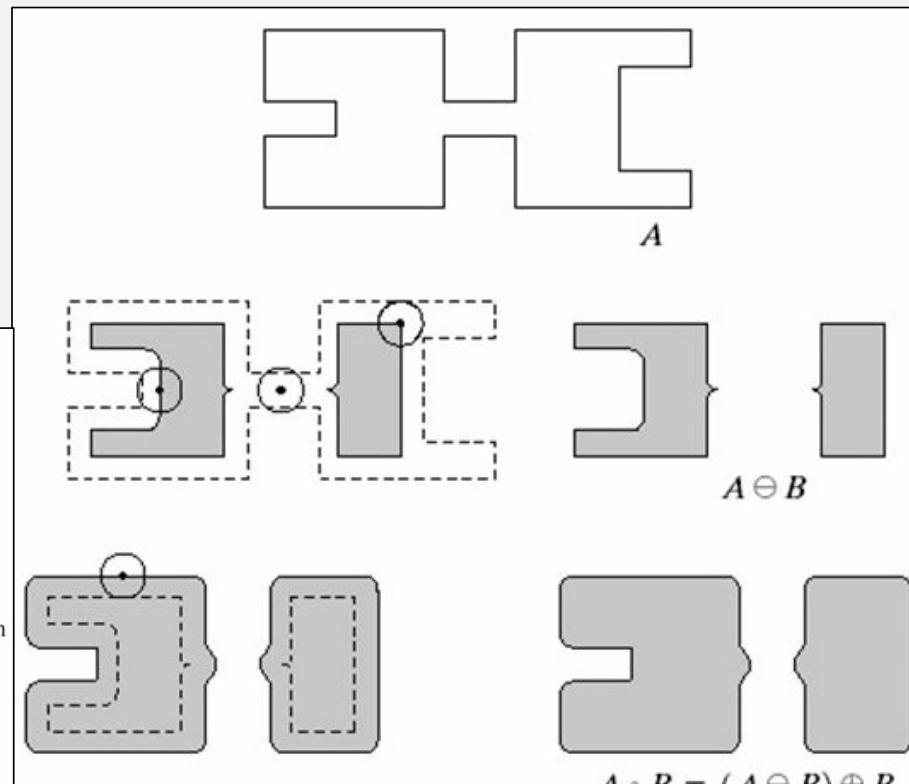

a b c

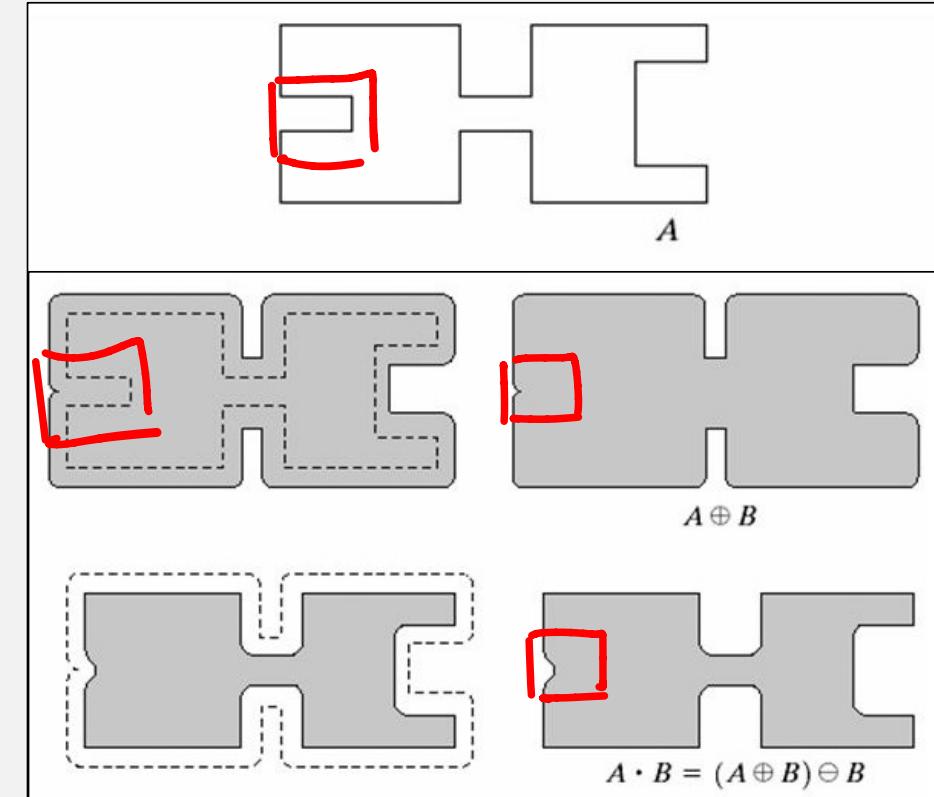

FIGURE 9.9 (a) Structuring element B “rolling” on the outer boundary of set A . (b) Heavy line is the outer boundary of the closing. (c) Complete closing (shaded).

CLOSING / OPENING

OPENING

CLOSING

Image from Gonzalez & Woods, Digital Image Processing

CLOSING / OPENING

- Fingerprint problem:

- Opening and closing are also duals of each other:

$$(A \cdot B)^c = A^c \circ \hat{B}$$

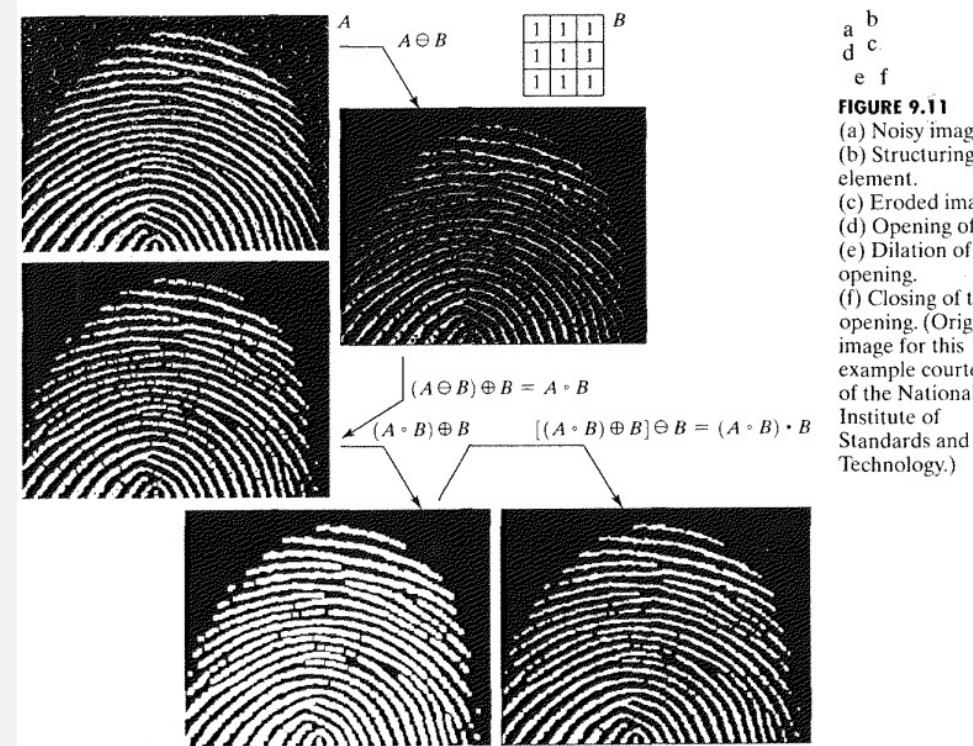

Image from Gonzalez & Woods, Digital Image Processing

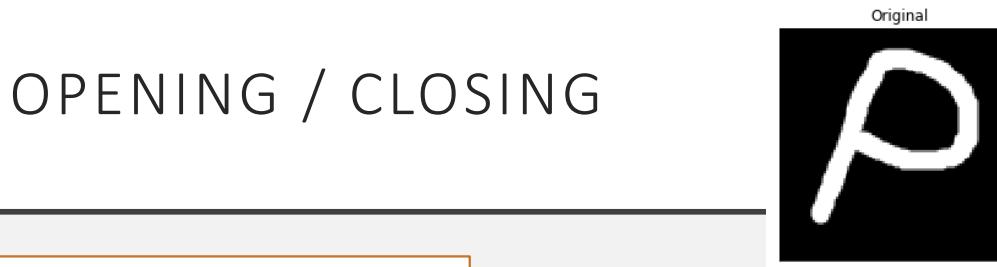

OPENING / CLOSING

```
import cv2
import numpy as np
from matplotlib import pyplot as plt

img = cv2.imread('P.png',0)
kernel = np.ones((5,5),np.uint8)

closing = cv2.morphologyEx(img,
cv2.MORPH_CLOSE, kernel)

opening = cv2.morphologyEx(img,
cv2.MORPH_OPEN, kernel)
```

§ morphologyEx()

```
void cv::morphologyEx ( InputArray src,  
                      OutputArray dst,  
                      int op,  
                      InputArray kernel,  
                      Point anchor = Point(-1,-1),  
                      int iterations = 1,  
                      int borderType = BORDER_CONSTANT,  
                      const Scalar & borderValue = morphologyDefaultBorderValue()  
)
```

Python:

```
dst = cv.morphologyEx( src, op, kernel[, dst[, anchor[, iterations[, borderType[, borderValue]]]]] )
```

Parameters

src	Source image. The number of channels can be arbitrary. The depth should be one of CV_8U, CV_16U, CV_16S, CV_32F or CV_64F.
dst	Destination image of the same size and type as source image.
op	Type of a morphological operation, see MorphTypes
kernel	Structuring element. It can be created using getStructuringElement .
anchor	Anchor position with the kernel. Negative values mean that the anchor is at the kernel center.
iterations	Number of times erosion and dilation are applied.
borderType	Pixel extrapolation method, see BorderTypes
borderValue	Border value in case of a constant border. The default value has a special meaning.

```

Closing or Opening?

HIT-OR-MISS TRANSFORMATION

If we try to find object X , $B_1 = X$, $B_2 = \text{dilated } X$
 X is enclosed by a small window W .

- The morphological hit-or-miss transform is a basic tool for shape detection.
- The objective is to find location of the shapes in the figure →

$$A \circledast B = (A \ominus B_1) \cap (A^c \ominus B_2)$$

① ការកែងក្រាម
② ការតូចបុរាណ

- Or (dual relationship)

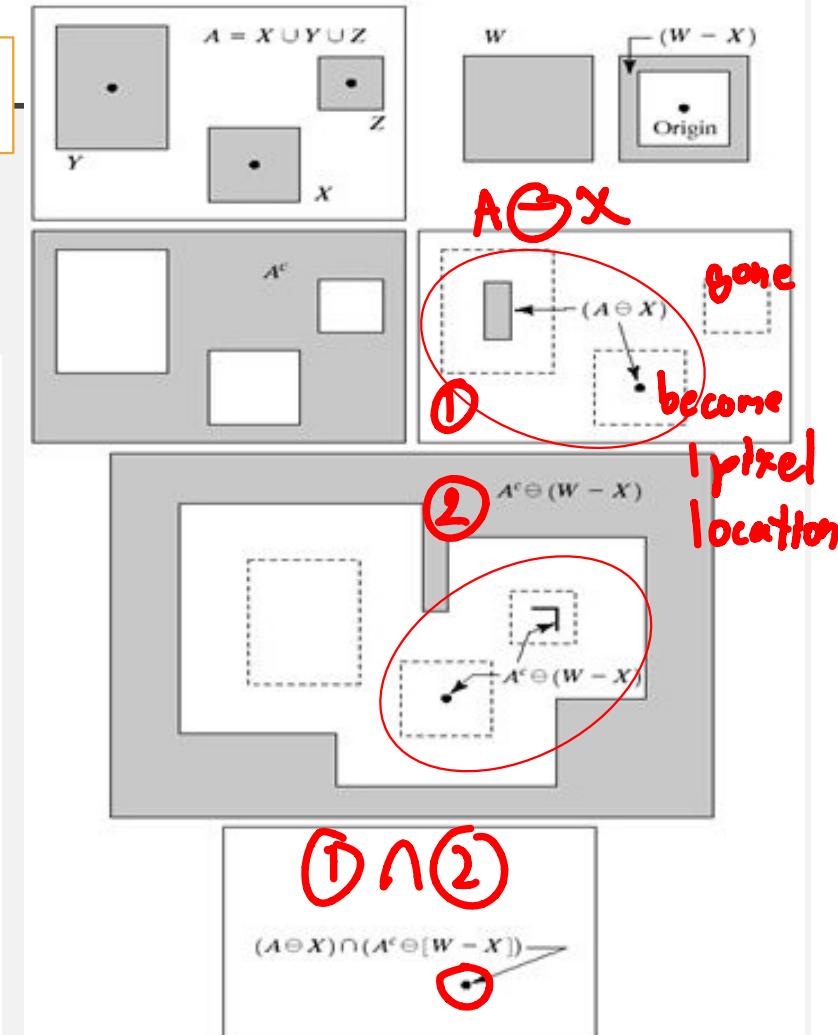

$$A \circledast B = (A \ominus B_1) - (A^c \oplus \hat{B}_2)$$

- $A \circledast B$ contains points (origin)
 B_1 found match in A and
 B_2 found match in A^c

(f) Intersection of (d) and (e), showing the location of the origin of X , as desired.

SOME BASIC MORPHOLOGICAL ALGORITHMS

- Boundary extraction
- Region filling
- Extraction of connected components
- Convex Hull
- Thinning
- Skeletons
- Pruning
- Summary of Morphological Operations on binary images

BOUNDARY EXTRACTION

- The boundary of set A, denoted by $\beta(A)$
- Eroding A by B then performing set difference:

$$\beta(A) = A - (A \ominus B)$$

- B is a suitable structuring element.

A നേരിട്ട്
B വുള്ള
ഭൂരി ഭൂരി $(A \ominus B) - A$

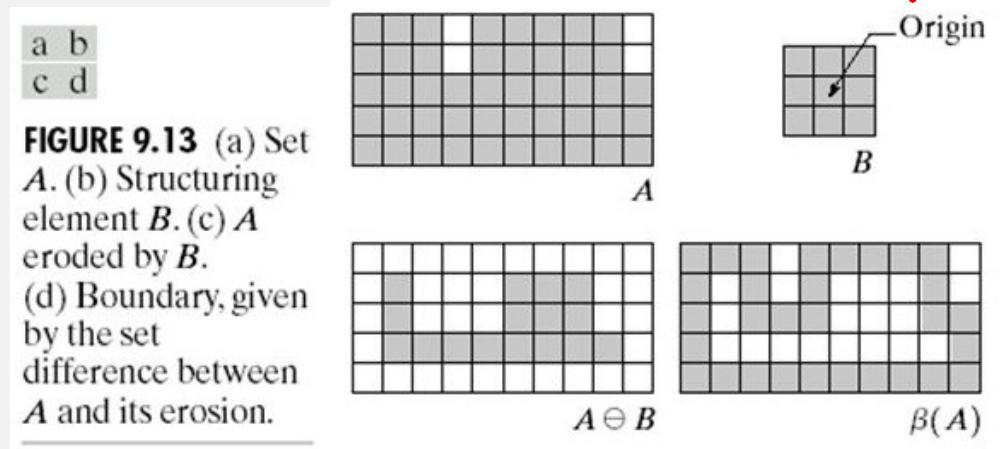

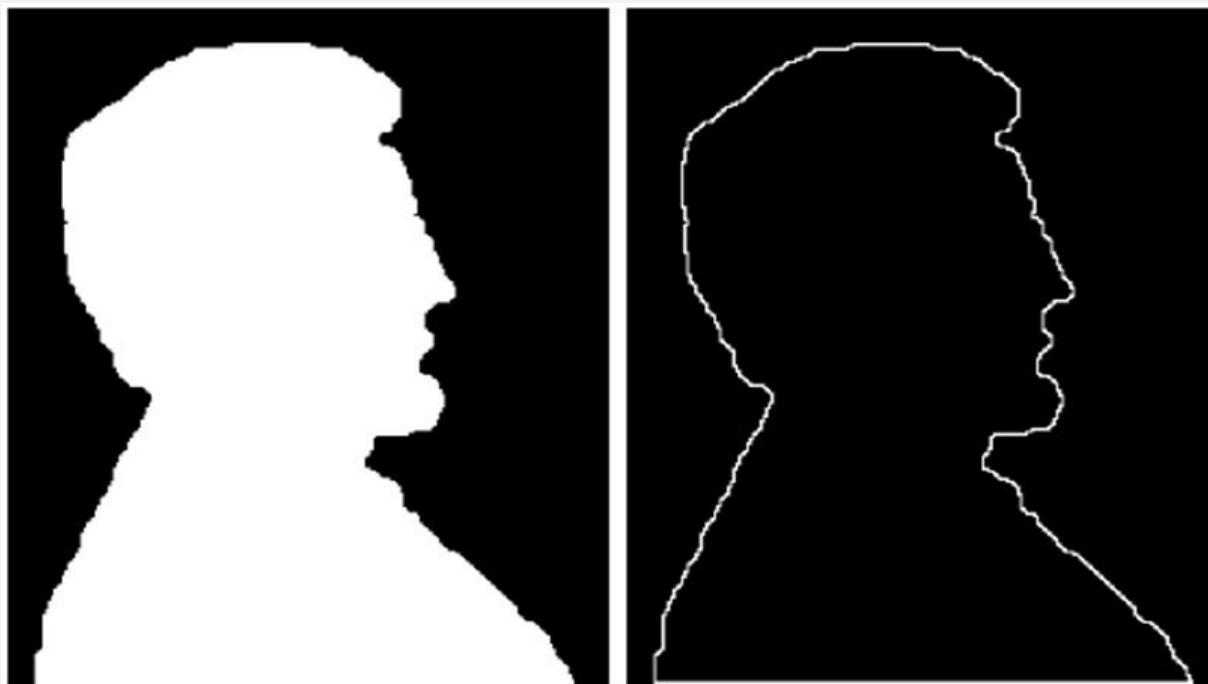

Image from Gonzalez & Woods, Digital Image Processing

BOUNDARY EXTRACTION

- Use different size of structuring element of 1, such as 5×5 result in a boundary between 2-3 pixels thick.

a b

FIGURE 9.14
(a) A simple binary image, with 1's represented in white. (b) Result of using Eq. (9.5-1) with the structuring element in Fig. 9.13(b).

Image from Gonzalez & Woods, Digital Image Processing

REGION FILLING

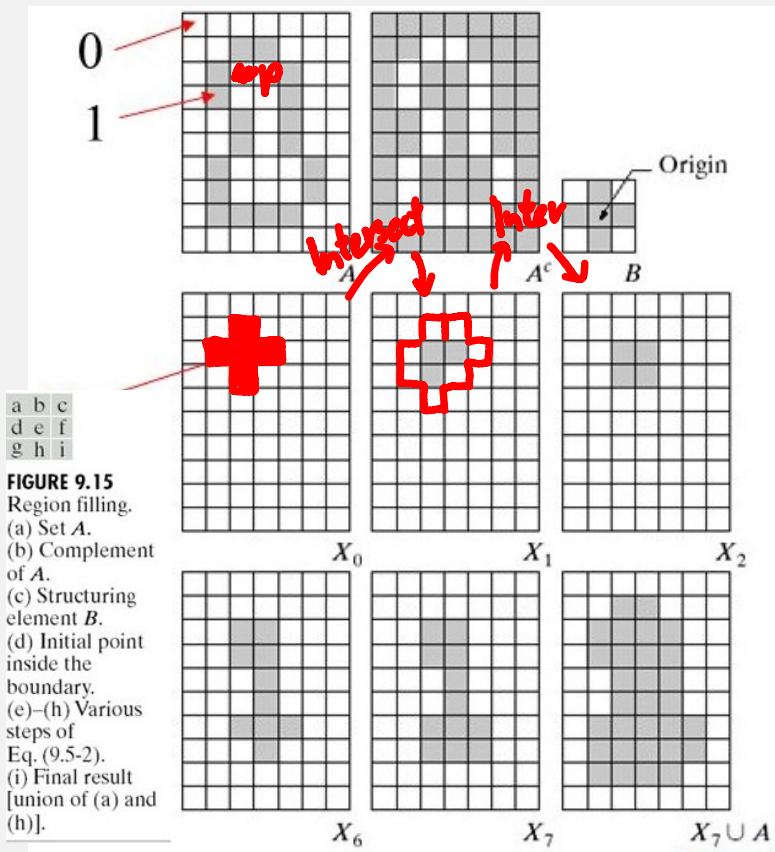

મનુષ્યજીવી

- The objective is to fill the entire region (starting at point p) with 1's.
- Non-boundary (background) points are labeled 0.
- The following procedure then fills the region with 1's:

$$X_k = (X_{k-1} \oplus B) \cap A^c \quad k = 1, 2, 3, \dots$$

- $X_0 = p$ or the starting point
- B is the symmetric structuring element. The algorithm terminates at iteration step k.
- Assuming a point inside each boundary is given.
- The algorithm terminates at iteration step k if $X_k = X_{k-1}$.
- X_k contains the filled holes; the set union of X_k and the original image contains all holes and its boundaries.

REGION FILLING

$$X_k = (X_{k-1} \oplus B) \cap A^c \quad k = 1, 2, 3, \dots$$

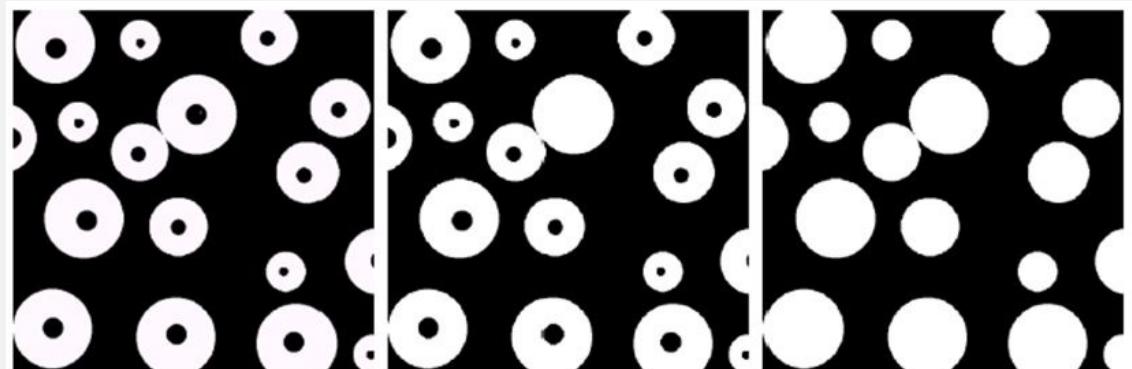

FIGURE 9.16 (a) Binary image (the white dot inside one of the regions is the starting point for the region-filling algorithm). (b) Result of filling that region (c) Result of filling all regions.

$x_8 = x_9$ Image from Gonzalez & Woods, Digital Image Processing

so x_9 = terminated

EXTRACTION OF CONNECTED COMPONENTS

- Let Y represents a connected component contained in a set A and assume that a point p of Y is known. Then the following iterative expression yields all the elements of Y : X_0 *the pixel 1st to be found*

$$X_k = (X_{k-1} \oplus B) \cap A \quad k = 1, 2, 3, \dots$$

- The algorithm terminates at iteration step k if $X_k = X_{k-1}$.
- Similar to region filling except use A instead of its complement.

A^C

EXTRACTION OF CONNECTED COMPONENTS

REGION FILLING

Python: `cv2.floodFill(image, mask, seedPoint, newVal[, loDiff[, upDiff[, flags]]]) → retval, rect`

- **seedPoint** – Starting point.
- **newVal** – New value of the repainted domain pixels.
- **loDiff** – Maximal lower brightness/color difference between the currently observed pixel and one of its neighbors belonging to the component, or a seed pixel being added to the component.
- **upDiff** – Maximal upper brightness/color difference between the currently observed pixel and one of its neighbors belonging to the component, or a seed pixel being added to the component.
- **rect** – Optional output parameter set by the function to the minimum bounding rectangle of the repainted domain.

```
import cv2
import numpy as np
from matplotlib import pyplot as plt

# Read image
img = cv2.imread("zen.png", 0)

# Threshold.
# Set values equal to or above 127 to 0. Set values below 127 to 255.
ret, thresh1 = cv2.threshold(img, 127, 255, cv2.THRESH_BINARY)

# Closing to connect edges
kernel = np.ones((5,5),np.uint8)
closing = cv2.morphologyEx(thresh1, cv2.MORPH_CLOSE, kernel)

# Copy the thresholded image.
im_floodfill = closing.copy()

# Mask used to flood filling.# Notice the size needs to be 2 pixels than the image.
h, w = closing.shape[:2]
mask = np.zeros((h+2, w+2), np.uint8)

# Floodfill from point (0, 0)
cv2.floodFill(im_floodfill, mask, (55,55), 255)
```

◆ connectedComponents() [2/2]

```
int cv::connectedComponents ( InputArray image,  
                            OutputArray labels,  
                            int connectivity = 8 ,  
                            int ltype = CV_32S  
)
```

binary image

Python:

```
cv.connectedComponents(           image[, labels[, connectivity[, ltype]]] ) -> retval, labels  
cv.connectedComponentsWithAlgorithm( image, connectivity, ltype, ccctype[, labels] ) -> retval, labels
```

```
#include <opencv2/imgproc.hpp>
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Parameters

- image** the 8-bit single-channel image to be labeled
- labels** destination labeled image
- connectivity** 8 or 4 for 8-way or 4-way connectivity respectively
- ltype** output image label type. Currently CV_32S and CV_16U are supported.

https://docs.opencv.org/4.5.3/d3/dc0/group__imgproc__shape.html#gaedef8c7340499ca391d459122e51bef5

◆ connectedComponentsWithStats() [2/2]

```
int cv::connectedComponentsWithStats ( InputArray image,
                                      OutputArray labels,
                                      OutputArray stats,
                                      OutputArray centroids,
                                      int          connectivity = 8 ,
                                      int          ltype = CV_32S
                                    )
```

Python:

```
cv.connectedComponentsWithStats(           image[, labels[, stats[, centroids[, connectivity[, ltype]]]]] ) -> retval, labels, stats, centroids  
cv.connectedComponentsWithStatsWithAlgorithm( image, connectivity, ltype, ccctype[, labels[, stats[, centroids]]] ) -> retval, labels, stats, centroids
```

```
#include <opencv2/imgproc.hpp>
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Parameters

- image** the 8-bit single-channel image to be labeled
- labels** destination labeled image
- stats** statistics output for each label, including the background label. Statistics are accessed via stats(label, COLUMN) where COLUMN is one of [ConnectedComponentsTypes](#), selecting the statistic. The data type is CV_32S.
- centroids** centroid output for each label, including the background label. Centroids are accessed via centroids(label, 0) for x and centroids(label, 1) for y. The data type CV_64F.
- connectivity** 8 or 4 for 8-way or 4-way connectivity respectively
- ltype** output image label type. Currently CV_32S and CV_16U are supported.

CONNECTED COMPONENT

```
import cv2
import numpy as np
from matplotlib import pyplot as plt

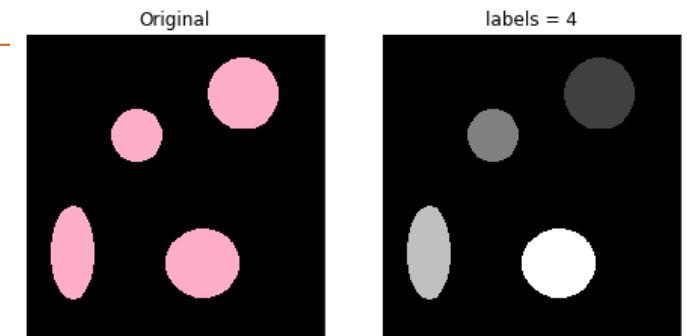

img_rgb = cv2.imread("4objects.png")
img = cv2.cvtColor(img_rgb, cv2.COLOR_BGR2GRAY)

ret,thresh1 = cv2.threshold(img,127,255,cv2.THRESH_BINARY)

# You need to choose 4 or 8 for connectivity type
connectivity = 4

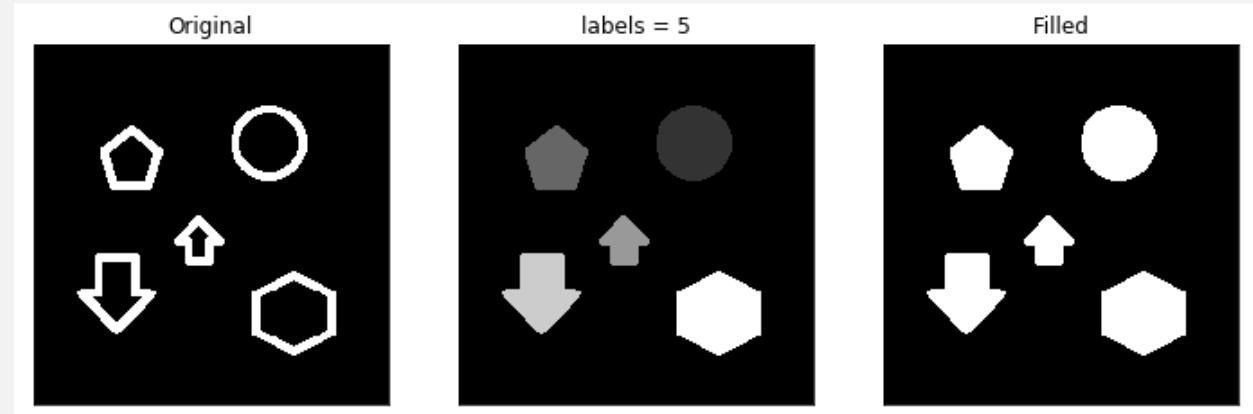

output = cv2.connectedComponentsWithStats(thresh1, connectivity, cv2.CV_32S)

# Get the results
# The first cell is the number of labels
num_labels = output[0]-1
# The second cell is the label matrix
labels = output[1]
# The third cell is the stat matrix
stats = output[2]
# The fourth cell is the centroid matrix
centroids = output[3]
```

CONNECTED COMPONENT

- Fill The region and count the number of objects.
- How many Labels?
- Let's calculate!

ការរួមចាយអំពីសំណងក្នុង
ក្រោចតាម convex

CONVEX HULL

not convex
ဘើ

- A set A is said to be **convex** if the straight line segment joining any two points in A lies entirely within A.
- The convex hull H of an arbitrary set S is the smallest convex set containing S.
- Let B^i , $i = 1, 2, 3, 4$, represent 4 structuring elements, the procedure: $X_0^i = A$

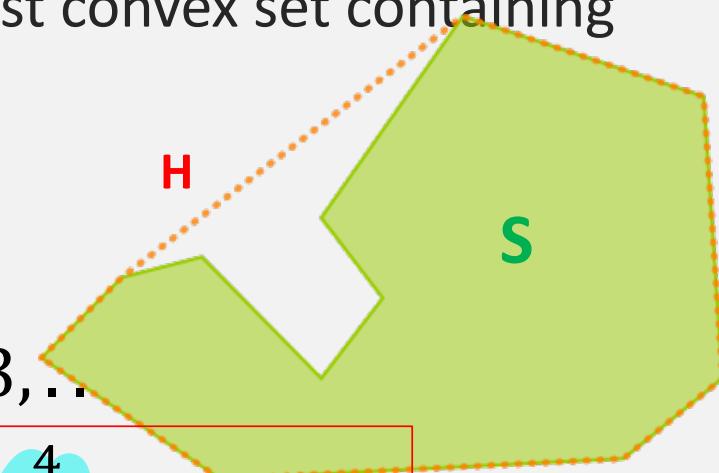

$$X_k^i = (X_{k-1}^i \odot B^i) \cup A ; k = 1, 2, 3, \dots$$

Convergence in
the sense that $X_k^i = X_{k-1}^i$

$$D^i = X_{conv}^i$$

Convex hull of A, $C(A)$ is

$$C(A) = \bigcup_{i=1}^4 D^i$$

Simplified version
of hit-or-miss
transform

THINNING ນາ ແກ່ນວັດ

- Thinning of a set A by a structural element B is denoted $A \otimes B$

$$A \otimes B = A - (A \odot B) \quad \text{Only pattern matching}$$

$$A \otimes B = A \cap (A \odot B)^c$$

- A sequence of structural elements:

$$\{B\} = \{B^1, B^2, B^3, \dots, B^n\} \quad \text{Different rotated versions}$$

$$A \otimes \{B\} = ((\dots ((A \otimes B^1) \otimes B^2) \dots) \otimes B^n)$$

- The process is to thin A by one pass with B^1 then thin the result by one pass with B^2 Until B^n repeat until no further changes occur.

THINNING

- Thinning process:

FIGURE 9.21 (a) Sequence of rotated structuring elements used for thinning. (b) Set A . (c) Result of thinning with the first element. (d)–(i) Results of thinning with the next seven elements (there was no change between the seventh and eighth elements). (j) Result of using the first element again (there were no changes for the next two elements). (k) Result after convergence. (l) Conversion to m -connectivity.

THICKENING

B : same as thinning

- Morphological dual of thinning:

$$A \odot B = A \setminus (A \ominus B)$$

$$A \odot \{B\} = ((\dots ((A \ominus B^1) \ominus B^2) \dots) \ominus B^n)$$

A separate algorithm for thickening is seldom used in practice.

The usual procedure is to thin the background of the set in question and then complement the result.

Depending on the nature of A, may result in disconnected points.

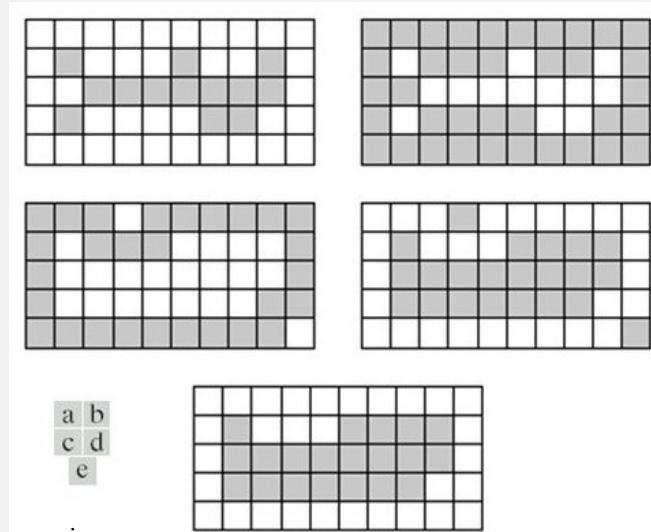

FIGURE 9.22 (a) Set A . (b) Complement of A . (c) Result of thinning the complement of A . (d) Thickened set obtained by complementing (c). (e) Final result, with no disconnected points.

SKELETONS

- A skeleton of a set A consists of points z that is the center of a maximum disk.
- The disk touches the boundary of A at two or more different places.
- A maximum disk is a circle in A that cannot be enclosed by another circle that is also in A.
- The figure on the right → shows sets of possible maximum disks and dotted line is the skeleton.

SKELETON VS. THINNING

SKELETON VS. THINNING

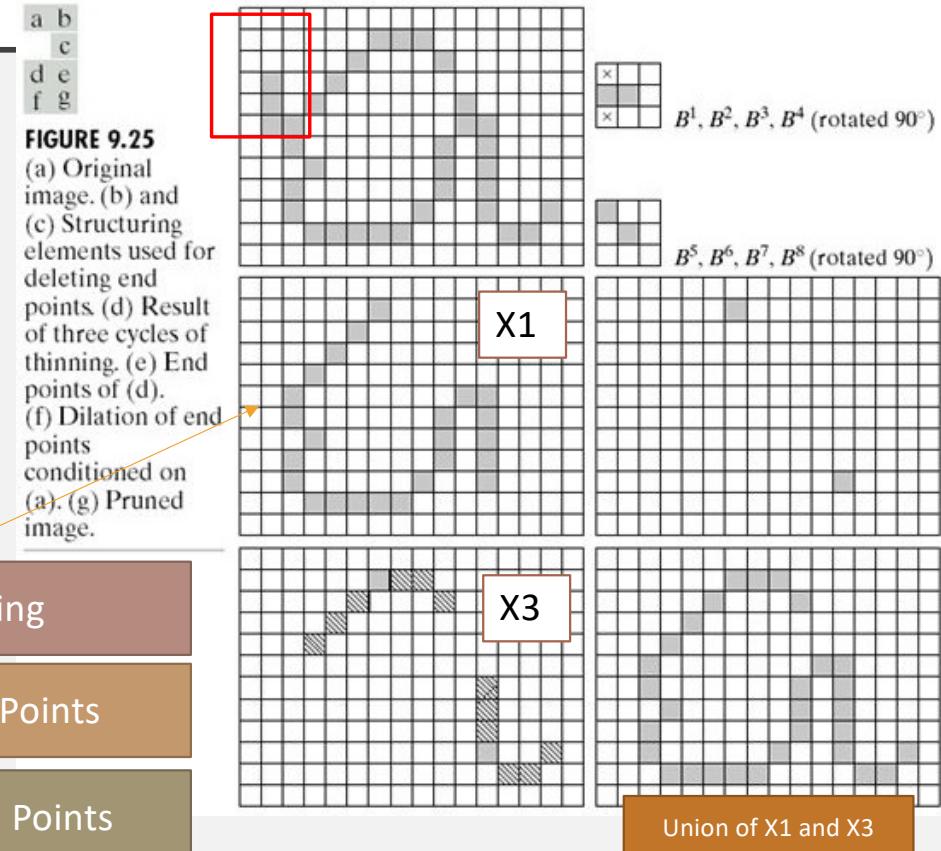

```
from skimage.morphology import skeletonize, thin  
  
image = cv2.imread("circuitbw.png", 0)  
th, image = cv2.threshold(image, 127, 1, cv2.THRESH_BINARY)  
skeleton = skeletonize(image)  
thinned = thin(image)
```

PRUNING

- An essential complement to thinning and skeletonizing algorithms because these procedures tend to leave parasitic components (cleaned up by post-processing).
- To handle spurs caused during erosion e.g., “a” character →
- Suppressing the spurs by successively eliminating its end point.

3 times all the spurs are gone

Skeleton of a hand-printed “a”

EXTENSION TO GRayscale IMAGES

- Dilation : **การเพิ่ม** **การหา Max**

$$(f \oplus b)(s, t) = \max\{f(s - x, t - y) + b(x, y) | (s - x), (t - y) \in D_f; (x, y) \in D_b\}$$
 - Erosion : **การลด** **การหา Min**

$$(f \ominus b)(s, t) = \min\{f(s + x, t + y) - b(x, y) | (s + x), (t + y) \in D_f; (x, y) \in D_b\}$$
 - Opening

$$f \circ b = (f \ominus b) \oplus b$$
 - Closing

$$f \cdot b = (f \oplus b) \ominus b$$
- D_f and D_b are domains of f and b

Dilation	$A \oplus B = \{z (\hat{B})_z \cap A \neq \emptyset\}$
Erosion	$A \ominus B = \{z (B)_z \subseteq A\}$
Opening	$A \circ B = (A \ominus B) \oplus B$
Closing	$A \cdot B = (A \oplus B) \ominus B$

EXTENSION TO GRayscale IMAGES

- Erosion and Dilation in Grayscale

APPLICATIONS OF GRAY-SCALE MORPHOLOGY

- Morphological smoothing
 - Opening followed by closing to remove or attenuate both bright and dark artifacts or noise.
- Morphological gradient
 - Dilation and erosion are used to compute morphological gradient
 - $g = (f \oplus g) - (f \ominus g)$

APPLICATIONS OF GRAY-SCALE MORPHOLOGY

- Textural segmentation
 - Two texture regions in figure below (circular blobs with different diameters).
 - The objective is to find the boundary between two regions based on their textural content.

a b

FIGURE 9.35
(a) Original image. (b) Image showing boundary between regions of different texture. (Courtesy of Mr. A. Morris, Leica Cambridge, Ltd.)

Algorithm:

1. Perform opening on the image by using successively larger structuring elements until small blobs are vanished.
2. Perform closing to join large blobs together
3. Perform intensity thresholding

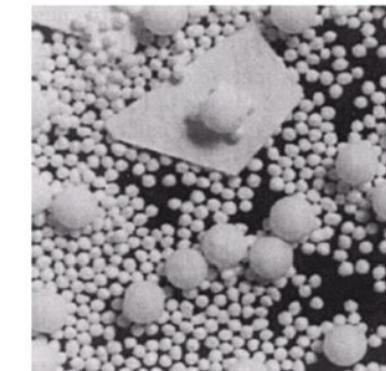

APPLICATIONS OF GRAY-SCALE MORPHOLOGY

- Granulometry 

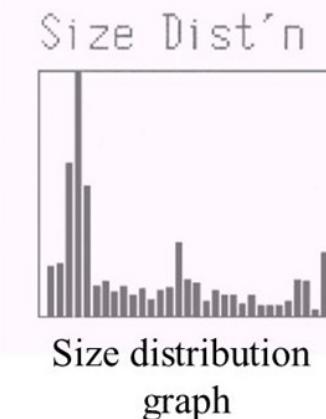

- To determine size distribution of particles in an image.

Method:

1. Perform opening using structuring elements of increasing size
2. Compute the difference between the original image and the result after each opening operation
3. The differenced image obtained in Step 2 are normalized and used to construct the size-distribution graph.

EXERCISE #1:

- Fill The region and count the number of objects.
- How many Labels?
- Let's calculate!

EXERCISE #2:

- Using morphological operation to count the number of 'bacteria.png' below:
- How do you measure the performance?
